

DIO1628

Three Port, 6GHz, High-Speed Differential MIPI Switch

Features

- Supply voltage: 1.65V to 5.5V
- Quiescent Current: 17uA
- Low On Resistance: 10Ω
- -3dB differential Bandwidth: 6GHz(typ.)
- Package: LGA1.7*2.4-24

Descriptions

The DIO1628 is a high-speed analog switch. The pin out is designed to ease differential signal layout and is configured as triple-pole, double-throw switch (TPDT). The DIO1628 is optimized for switching between two MIPI devices, such as cameras or LCD displays and on-board MAP.

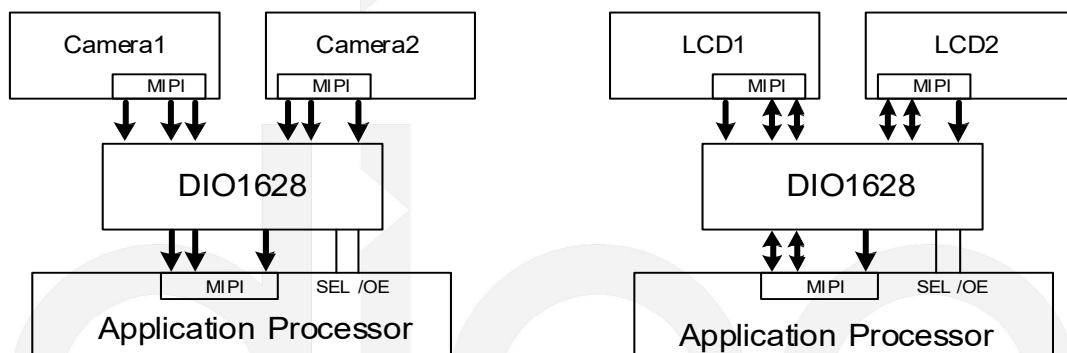

Applications

- Dual Camera for Cell Phones
- Dual LCD Monitor, Digital Camera Displays

The DIO1628 is compatible with the requirements of MIPI. The low-capacitance design allows the device to switch signals that exceed 6GHz in frequency. Superior channel-to-channel crosstalk immunity minimizes the interference and allows the transmission of high-speed differential signals and single-ended signals, as described by the MIPI specification.

The DIO1628 is available in LGA1.7*2.4-24 package. Standard Products are Pb-free and halogen-free.
